

Pilot Scalability Scorecard

A practitioner reflection tool for assessing whether a pilot has the evidence, capacity, and context needed to take on the challenge of scaling.

How to score: Rate each condition 1-5 based on the evidence available at the end of the pilot. Score the current condition, not your confidence in the technology alone.

Use the score to ask: What is working? What is still assumption-dependent? What must be strengthened before volume, geography, or complexity increases?

Condition	Core Question	A scalable pilot needs to demonstrates	Reflection prompts and post-pilot lens	Score 1-5
1. Measure viability	Does it actually work?	Reliable, measureable, cost-effective performance.	Also consider: Cost effectiveness and savings per \$. Post-pilot: Do savings need adjustment? Can installation be made more effective?	
2. Market viability	Will enough customers participate?	Durable demand beyond the initial cohort.	Also consider: Customer education and motivation. Post-pilot: Was the experience positive enough to sustain participation and referrals?	
3. Customer reach	Can the program consistently find and convert repeatedly?	A repeatable customer acquisition and access mechanism.	Also consider: Enrollment volume and conversion Post-pilot: Was demand mostly pent-up/eager. adopters, or did the pilot reach new customers?	
4. Delivery capacity	Can the market deliver the work repeatedly and within certain timeframes?	Sufficient contractors, vendors, and skilled workforce.	Also consider: Vendor network and workforce development. Post-pilot: How much can the network deliver in a defined timeframe? What is realistic now vs. buildable next?	
5. Operating capacity	Can the organization manage the increasing volume?	Repeatable processes, data, approvals, QA reporting and coordination.	Also consider: Data and reporting. Post-pilot: What should be automated, consolidated, standardized, or offloaded to partners?	
6. Organizational / context readiness	Can the model be sustained and adapted?	Funding, governance, management, institutional capacity, and local adaptability.	Also consider: Program management and geographic replicability. Post-pilot: Where does the market need to grow? What training, certifications, and support will make the expansion more uniform?	

1 – Not demonstrated Little evidence; major unknowns remain	2- Early signal Some evidence, but highly dependent on pilot conditions	3 – Partially demonstrated Workable model with meaningful gaps or variability	4 – Strong evidence Repeatable under expected operating conditions	5 – Demonstrated and resilient Evidence suggests the model can absorb greater volume/complexity
---	---	---	--	---

Total Score: ____ / 30	Average: ____ / 5	Lowest-scoring condition: _____	My scale-up confidence (1-5): ____
What is strongest today?	Biggest gap to close?	Evidence I still need:	Next scale test:

Interpretation: Use the pattern, not only the total. A high average with one weak condition can still create a scaling bottleneck. A strong score means that evidence is accumulating, not that uncertainty has disappeared.
